

# VIGIALERT®

VigiAlert®, a state-of-the-art enterprise software technology, enables authorized personnel to securely send alert messages to specific regions using graphically rich and user-friendly software with a few mouse clicks.

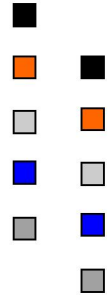

- Select Display** | The view selector option provides the user flexibility to select the environment of choice i.e. Graphical Interface or Organizational interface.
- Alert Region** | Checking the 'Mark Alert Region' would place a circular region on the GIS display, which can be zoomed in and out of by changing the 'Radius' field.
- Notify** | User can specify 'Text' or 'Voice' or both. The text can be typed in the textbox under 'Notify' icon. The software will automatically guide user for recording voice on computer when 'Voice' option is selected.
- Send Alert** | User is prompted to categorically select all those in the marked region is to be alerted. This enables the user to send secure messages to a small group such as all police officers in the specified area, or to a large group such as all citizens in the selected area. This can be used to alert all First Responders about suspected pandemic or terrorism incidents. Therefore VigiAlert® can be used flexibly to talk to one individual or thousands of individuals depending on their roles or location.
- Click2Call** | This feature enables the user to make a IP phone call using the inbuilt VOIP functionality to anyone in the selected region by selecting the pushpin icon on the screen followed by clicking the 'Click2Call' button.
- Navigation** | The 'Navigation Toolbar' is developed to assist USER in manipulating the Alert Region over the GIS Map. The Alert Region can be locked by selecting 'Lock Alert Region' option.
- Radar View** | The Radar View overlays the GIS Map with the database of First Responder personnel in the Alert Region. There is also a provision to track location (Field Personnel) in future software release.
